Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

NOTE: This is a 'working draft' sequence. It currently consists of 21 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will

* (see http://www.hgsc.bcm.tnc.edu/docs/Genbank_draft_data.html).

* NOTE: This is a 'working draft' sequence. It currently

* Consists of 7 contigs. The true order of the pieces

* is not known and their order in this sequence record is

* arbitrary. Gaps between the contigs are represented as

* runs of N, but the exact sizes of the gaps are unknown.

* This record will be updated with the finished sequence

* as soon as it is available and the accession number will

* be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Worley, K.C.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).
NOTE: This is a 'working draft' sequence. It currently consists of 56 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Submitted (08-AUG-2002) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77036, USA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     * sequencing reads that have not been assembled into contigor. Runs of N are used to separate the reads and the order in which they appear is completely * arbitrary. Low pass sequence sampling is useful for identifying clones that may be gene-rich and allows overlap relationships among clones to be deduced. * However, it should not be assumed that this clone * will be sequenced to completion. In the event that the record is updated, the accession number will be preserved.
                                                                                                                                                                                                                       All repeats were identified using RepeatMasker:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention comprises a method of diagnosing a polymorphism in the human P2X7 gene, by determining the the sequence at specific positions within the gene. The method of the invention is useful for identifying substances which can be used to treat P2X7-associated disorders (especially inflammation and immune diseases). The method can be used to detect predisposition/susceptibility to P2X7-associated diseases. The method can also be used in developing new drugs that target particular alleles. The polymorphisms identified by the method of the invention can be used as genetic markers in linkage studies. The present DNA sequence represents the coding region of the human P2X7 gene.

The present sequence is the coding sequence for human purinergic receptor P2X_7/P2x. This sequence can be used to treat disorders of the nervous system, particularly diseases with a component of chronic inflammation, such as Alzheimer's disease, diseases involving acute or chronic inflammation such as rheumatoid arthritis, amyloidosis, bacterial, viral and other microbial infections, disorders of the haematopoietic system and immune response such as autoimmune disorders, allergies and impoproliferative disorders, diseases involving apoptotic cell death, such as cardiac and cerebral ischaemia and microbial infections,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AGIATGAGACGAACAAAGICACTCGGATCCAGAGCATGAATTATGGCACCATTAAGIGGT

1561 TGTTCAGGAAGCTGGTCCTGTCCAGCTCTCTCTCTCTCTC	RESULT 3 AAF98411 ID AAF98411 standard; cDNA; 2168 BP. XX AC AAF98411; XX	,	For insolated nucleic acids encoding polypeptides, useful for modulating PT e.g. cytokine and cell prollferation/differentiation activity, the immune system and hematopoiesis regulating activity - the immune system and hematopoiesis regulating activity - the immune system and hematopoiesis regulating activity - the prevented by the prevented in AAF98489 encode secreted continue AAB90667 - AAB90750. The cDNA clones are isolated from various continue AAB90667 - AAB90750. The cDNA clones are isolated from various continue and and may be used in the prevention, treatment and diagnosis of diseases associated with inappropriate protein expression. The colypeptides and nucleic acids may be used as nutrients or to modulate controlly and in modulation of the immune system. The cDNA sequences, convolved in modulation of the immune system. The cDNA sequences, proteins, their agonists and/or antagonists exhibit haematopoiesis controlly indiminatory activity; chemotactic/chemokinetic activity; haemostatic and thrombolytic activity; receptor/ligand activity; anti-inflammatory activity; and/or haematopoiesis activity; calherin/tumour suppressor activity; and/or tumour inhibition activity. Included in the invention are probes

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This cDNA clone, designated CO390_1, codes for a novel human secreted protein (see AAW5830). It was isolated from a human adult brain cDNA library using methods selective for CDNSa that encode secreted proteins. The clone is deposited in composite clone factors and contain an oligonucleotide (see AAT99732) has been designed to isolate CO390_1 DNA from the composite clone. The nucleotide sequence may contain an Alu repetitive element. Novel cDNA clones sequence may contain an Alu repetitive element. Novel cDNA clones can claimed. These can be used for recombinant production of the secreted proteins for analysis, characterisation, diagnostic or harpourie use. They can also be used as tissue or mol. wt. markers, for chromosome identification, to identify genetic disorders, to generate continuous may have many biological activities. For cytckine, immunomodulator, chematopolesis regulating activity, tissue growth activity, activin contains.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This nucleic acid sequence encodes the human purinoreceptor (HPURR), which has been shown to be similar to P2x purinoreceptors isolated from both human and rat. The nucleic acid was discovered from a spinal cord DNA library (SCORNOI) incyte clone 555697, this was found by using a search for sequence alignments of amino acids. The consensus sequence was derived from the two overlapping and/or extended nucleic acid sequences: Incyte clones 555697 and 133269. These sequences can be used in the diagnosis, prevention, and treatment of disorders and diseases of
                                                                                                                                                                                                                                                                                                Huntington's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          the immune system, nervous system, cardiovascular, and of smooth muscle. For example, Alzheimer's, Huntington's, Parkinson's, Creutzfeldt-Jakob diseases, heart disease, stroke, thrombosis and other coagulation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            TTTTCCAGTATGAGACGAACAAAGTCACTCGGATCCAGAGCATGAATTATGGCACCATTA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The specification describes nucleic acids encoding a functional human purinoreceptor polypeptides PXX2 and PXX4. P2X polypeptides and polynuclectides are used to identify modulators, which may be used to treat and prevent pain, diseases of the nueroendocrine system, and auditory and vestibular disorders. P2X and P2X polynuclectides are a source of probes and primers, which may be used to identify homologous sequences, for gene localisation studies, and for gene therapy purposes. The polynuclectides may also be used to produce the polypeptide recombinantly. The P2X polypeptides are used to arise antibodies, and to identify inhibitors. The present sequence encodes human P2X4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Isolated polynucleotides, used to produce PX2 receptor polypeptides and identify potentially therapeutic compounds, encode a human P2X2 receptor polypeptide -

This cDNA encodes a human brain P2X-1 receptor polypeptide. The P2X receptor splice variants (P2X-1, P2X-2 and P2X-3 isoforms) can be recombinantly expressed by a host cell genetically engineered with a recombinantly expressed by a host cell genetically engineered with a vector containing the encoding nucleic acids. The receptors can be used to identify agents which modulate the activity of the receptors for use in clinical conditions such as brain stroke, brain or spinal cord traumas, infection and inflammation, cognitive disorders, epilepsy, affective and mood alsorders in general, including depression, various movement disorders including parkinson's disease, Huntingtons Chorea and Schizophrenia, as well as those conditions that are associated with the development of correction, production of antibodies and products can also be used for detection, production of antibodies and production of transgenic animals as models for mutation and structure/activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CIGIGACCAACACTICIAAACTIGGAITICCGGAICIGGGAIGIGGCGGAITAIGIGAIAC 287

                                                                                                                                                                                                  Rat P2x clone 3 (AAV33853) codes for the superior cervical ganglion P2x receptor (AAW04216), a ligand-gated ion channel that opens upon binding of extracellular APP. It was isolated by screening a rat testis cDNA bank with a probe obtd. by PCR amplification of testis GDNA using primers (see also AAT33857-58) based on the rat vas deferents P2x receptor DNA (AAT33857). A rat dorsal ganglion P2x receptor CDNA (AAT33854) was similarly isolated, and a human homologue (AAT33855) was also identified. The CDNA can be used to produce recombinant P2x receptors in host (e.g. COS) cells.

The present sequence is human P2X4 receptor DNA containing its open reading frame with EcoRI restriction used for subcloning. P2X receptors are ligand-gated ion channels while P2X receptors operate generally through a G-protein coupled system. P2X purinoreceptor drugs are potential therapeutic agents in several disorders including central nervous system or peripheral nervous system conditions, e.g., epilepsy, pain, depression, neurodegenerative disorders, disorders of the skeletal muscle such as neuromuscular diseases, disorders of the reproductive system, asthma, peripheral vascular disease, hypertension, immune system disorders, irritable bowel disorder, permature ejaculation, cystic fibrosis and chronic bronchits. P2Y purinoreceptors mediate the activity of extracellular nucleoide triphosphates to regulate chloride secretion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            TCTGTTCCTCTGACCGAGGTTGTAAAAGGGATGGATGGACCCGCAGAGGAATTC 468
